RealGold

Frequently Asked Questions

Regenerative Assets LLC · Draft for Review

The following questions and answers represent the public-facing FAQ for Real.Gold. This draft has been prepared for team review — items flagged **[Review]** reflect areas identified as outdated or incomplete relative to the current product structure.

THE BASICS

What's unique about RealGold?

RealGold sets a new standard for responsible and regenerative gold-backed assets — it enables ownership of gold without mining or extraction. The certified gold-in-ground is managed as real estate rights on a cryptographic ledger, and results in the sale of RealGold assets in two forms:

1. Fractional real-estate shares that qualify for tax-deferred §1031 exchanges. 2. RealGold crypto tokens (RGT) that trade 24/7 at ounce parity with spot gold.

No mining, no vault storage — just fully certified, tradable gold that stays in the ground.

How do you know that the gold in the ground is actually there?

In a similar manner to knowing that gold in a vault is actually there — via verification by 3rd party, certified experts.

Every gold mining company worldwide relies on certified geologists and geological assays to measure in-ground resources, and so does RealGold. Each gold claim that enters the RealGold system must first submit a Resource Report authored by a Certified Professional Geologist (CPG). The CPG evaluates historical mining activity, supervises collection of core samples, validates laboratory assays through strict QA/QC protocols, and constructs a 3-D geographical block model that categorizes the mineral resources as Measured, Indicated, or Inferred — each level reflecting a degree of geological certainty.

All of this information is compiled into a Certified Resource Report, which must meet and/or exceed N.I. 43-101 (Canadian) and SK-1300 (American) securities reporting standards — the industry's most rigorous proof that an in-ground mineral resource exists.

Every resource report, block model, and subsequent audit of RealGold's reserves are published to the Real Assets Registry, a public, tamper-proof Holochain ledger. Via the browser-based RealGold block explorer, anyone can inspect the data to verify that each RGT or DST share is matched at least 2:1 to specific, independently certified ounces still safely in the ground.

When will the gold get dug up?

Ideally, never. RealGold safeguards gold in "nature's vault," managing ownership in place just as bullion banks track bars on vault shelves. Keeping gold where the earth put it avoids the cost, carbon, and security overhead of digging it out only to lock it in a different hole called a vault.

The mineral rights are held by a perpetual land stewardship trust. Trustees must demonstrate, year-by-year, that the Trust is adding regenerative value — performing environmental remediation, restoring habitat, hosting community infrastructure — so the most profitable option remains not mining.

Still, history teaches us to plan for edge cases: eminent-domain takings, national emergencies, or future technology that changes the cost-benefit calculus. To protect holders under any scenario, RealGold withholds 50–80% of the certified ounces as an un-issued reserve. If the gold is ever mined, you still own your portion of the interest in it and could opt in to cashing out your RealGold holdings.

ACQUIRING & TRADING REALGOLD

How can I acquire RealGold?

Accredited Investors may acquire RealGold in two ways:

1. Purchase RealGold DST shares of IRS §1031-eligible real estate through qualified intermediaries. 2. Buy RGT tokens at https://real.gold or via crypto trading pairs on a DEX or CEX.

A waiting list for first-priority allocations is available on the Real.Gold website.

> ■ *[Review] — Confirm the waitlist mechanism is still active and update the acquisition copy to reflect Courbet DST as the inaugural offering.*

Can I exchange RealGold for physical gold?

Yes, through our partnership with an accredited bullion broker. To honor the non-extractive charter, redemptions are fulfilled with bullion already mined and refined — typically not by mining the in-ground resources that back RealGold.

At launch, redemption is limited to asset depositors (those who originally placed mineral rights into the system). As the Treasury builds a buffer of vaulted bullion, general token-holders may also access this redemption process. Standard vault-withdrawal and broker fees apply, and caps on volume or frequency may be imposed to preserve the spirit of RealGold's non-extractive mandate.

Why would RealGold trade on par with the commodities spot price of gold?

Traditional exploration companies sell future ounces that must still be drilled, permitted, mined, and refined — steps loaded with cost, time, and regulatory risk. RealGold removes those unknowns, so the market can value each ounce on par with the live spot price of gold bullion:

1. Over-collateralization — For every ounce unit of RealGold released to markets, at least two certified ounces remain in the ground. If extraction were ever to occur, this reserve more than covers the all-in sustaining cost (AISC) of mining, making every holder whole.

2. Easy convertibility — At any time, land-share owners may use the guaranteed buyer clause to sell to the RealGold Treasury for an equivalent number of RGT tokens, then exchange those tokens for dollar-pegged

stablecoins on secondary markets.

3. Active liquidity support — RealGold will maintain continuous buy-and-sell liquidity on decentralized and centralized exchanges, guided by real-time gold price feeds, so day-to-day trading naturally hugs the global XAU price.

With excess backing, a clear redemption path, and round-the-clock liquidity, RealGold functionally acts no differently than trading receipts on gold in a vault.

How is RealGold different from Commodities Exchange or ETF trading of gold?

Commercially traded gold instruments — COMEX futures, LBMA forwards, and most gold ETFs — trade claims on already-mined bullion stacked in a handful of vaults worldwide. Investors pay storage, insurance, and audit fees, and never actually "hold" the gold. Redemption is often onerous, involving delivery of 400+ ounce "Good-Delivery" bars in London on a specific settlement day. Those bars carry the full ecological cost of mining and concentrate counterparty risk in a few vault operators.

RealGold flips that model, eliminating mining damage, storage costs, and single-point vault risk, while layering in a regenerative stewardship framework that turns an ancient store of value into a perpetual ecological endowment.

GOVERNANCE & STRUCTURE

Who upholds the integrity of RealGold?

Three purpose-built entities work together: the Real Assets Foundation maintains the Holochain Registry, certifies incoming geological assay data, and manages release schedules. The RealGold Treasury provides token issuance, redemption, and liquidity, and manages the bullion-redemption process. A network of perpetual stewardship trusts holds legal title to the mineral rights.

What is the Real Assets Registry?

The Registry is a tamper-resistant Holochain ledger managed by the non-profit Real Assets Foundation. It records every certified resource report, block-model ounce, audit, release schedule, token issuance/redemption, and regenerative impact score. Because the data live on a public, append-only ledger, anyone can verify at any time that every RGT or DST share is fully collateralized by certified in-ground gold and that new supply is unlocked only when impact targets are met.

What is the Tripartite Trust Framework?

The Tripartite Trust framework represents a fundamental reimagining of how we manage and steward land and resources. It rebundles property rights into three mutually accountable, interconnected trusts — Mineral, Biological, and Social — each serving as guardian of a vital aspect of the land. Through mutual accountability, the trusts ensure decisions benefit the whole rather than privileging one interest. The exact legal form varies by jurisdiction, but the goal is perpetual, accountable stewardship to people and planet.

How does RealGold ensure environmental and social impact?

Annual gold releases are conditional on meeting regenerative performance metrics — soil-carbon gains, water quality, biodiversity counts, local-hire hours, or other site-specific targets written into the Real Assets Registry. If a project falls short, new ounces will not be released.

LAUNCH & TEAM

When will RealGold be launched?

Our goal is to begin offering RealGold 1031-eligible DST interests as soon as possible. The RealGold cryptocurrency token launch will follow as we establish relationships with exchanges and crypto markets.

- *[Review] — Update with current timeline and any Courbet DST-specific launch milestones.*

Who is the team behind RealGold?

We're a cross-disciplinary team with backgrounds spanning technology, currency design, financial services, web3, real estate, and the mining industry. We'll publish a full team roster before launching. Our team is still growing — meet some of us by joining the RealGold Telegram channel, where we host an active community.

If you are interested in working with us, we'd love to hear from you. Email us at info@real.gold.

- *[Review] — Consider publishing team bios now; "before launching" framing is stale.*
